

NWT Housing Needs Survey - 2000

Overall Results & Community Detail

NWT Housing Needs Survey - 2000

Overall Results & Community Detail

**Government of the Northwest Territories
March 2000**

Minister's Message

NWT Housing Needs Survey - 2000

I am pleased to present the results of the NWT Housing Needs Survey - 2000. This is the first Housing Needs Survey since the creation of Nunavut, and reflects the realities of housing in the new Northwest Territories. The survey was completed by the Northwest Territories Housing Corporation (NWTHC) in partnership with the NWT Bureau of Statistics, Local Housing Organizations and communities.

The results of this survey show there are 2,726 households in need in the Northwest Territories, or about 1 out of 5 of our households. As you read the results of this survey, you will notice that not all communities have the same type of housing problems and need. In some communities the need is for renovations and repairs to existing homes rather than for new homes. In larger centres such as Yellowknife, Inuvik and Hay River, residents face problems of affordability rather than overcrowding or condition of the home.

The results of this survey are used by the NWT Housing Corporation to monitor changes in housing conditions and needs, as well as to assist in the targeting of housing resources to communities. The survey findings provide communities with the information needed to make decisions on where funding should be directed to address the specific housing problems and needs identified.

I wish to thank all those who took their time to complete this survey. Without the cooperation of respondents to surveys such as these, the ability of governments to design appropriate programs and set priorities would be significantly hampered.

Sincerely,

A handwritten signature in black ink on a light-colored background. The signature reads "Roger J. Allen" in a cursive style.

DEFINITIONS

Housing Problem

Housing problems included in this survey are divided into three categories: suitability, adequacy, and affordability as defined by national standards (see Appendix B for Technical Definitions).

Suitability

Suitability refers to the problem of overcrowding or whether a household has enough bedrooms appropriate for the number of people.

Adequacy

Adequacy refers to the physical condition of a dwelling or whether a household has basic facilities to provide a safe and healthy environment.

Affordability

Affordability problems exist when a household pays an excessive amount for shelter. A household has an affordability problem if more than 30% of a household's income is paid to shelter costs.

Core Need Income Threshold (CNIT)

The Core Need Income Threshold is an income limit for each community that represents the amount of income a household must have to be able to afford the cost of owning and operating a home or renting in the private market without government assistance (see Appendix C for the 2000 CNIT by community).

Core Need

If a household has any one housing problem (suitability, adequacy, or affordability) or a combination of housing problems, *and* a total household income below the community Core Need Income Threshold, the household is considered to be in core need.

NWT HOUSING NEEDS SURVEY - 2000

OVERALL RESULTS & COMMUNITY DETAIL

Overview

Recently, the Northwest Territories Housing Corporation (NWTHC) in partnership with the NWT Bureau of Statistics, Local Housing Organizations and communities, completed the NWT Housing Needs Survey - 2000 in all communities in the Northwest Territories. Key housing statistics based on the survey are presented in this report. Additional information from the survey is available on the NWTHC and the Bureau of Statistics' Web sites (<http://www.nwthc.gov.nt.ca> and <http://www.stats.gov.nt.ca>, respectively).

Statistics in this report are based on responses to housing needs questions from 5,189 households that were collected between September and November, 1999. Information on the methodology for the survey, technical definitions, sample sizes, standard errors and coefficients of variation, 2000 Core Need Income Thresholds (CNIT), and a copy of the questionnaire is included in the Appendixes to this report.

The results of this survey are used by the NWT Housing Corporation to monitor changes in housing conditions and needs, as well as to assist in the targeting of housing resources to communities. The survey findings provide communities with the information needed to make decisions on where funding should be directed to address the specific housing problems and needs identified.

Highlights of Housing Problems and Core Need

There were 13,405 occupied dwellings in the Northwest Territories at the time of the NWT Housing Needs Survey - 2000 (Table 1 shows the listings of NWTHC districts and communities). An estimated 4,037 households had some form of housing problem (30%), while 2,726 households were in core need (20%). The difference between those with problems and the core need value is that 1,311 of the households with housing problems had sufficient income to solve their housing problem without government assistance - and are therefore not considered in core need (Figure 1). Core need is generally defined as households with at least one housing problem *and* total household income below the CNIT. For more information on calculating core need see Appendix C.

Figure 1
Housing Problems and Core Need, by District
Northwest Territories

There was an increase in the number of NWT households in core need between the NWTHC's 1996 Housing Needs Survey and the 2000 Housing Needs Survey. Some 2,489 households (20%) were found to be in core need in 1996 (Table 2). In 2000, the number of households in core need had increased by 237, although the proportion of households in core need was virtually unchanged between the two surveys. However, the incidence of core need decreased in 22 of the 34 communities between 1996 and 2000. Compared with Canada, the incidence of core need in the Northwest Territories remains nearly twice the national rate.

For the NWT Housing Needs Survey - 2000, there is a somewhat lower incidence of core need in the North Slave District at 15% (1,033 households), compared with 25% in the South Slave District (866 households) and 26% in the Western Arctic District (827 households). Considering housing need for different types or size of communities (Figure 2), the survey indicates that 11% of households in Yellowknife are in core need (658 households), while 14% of households in Hay River, Fort Smith and Inuvik (468 households) and 38% of households in the remaining smaller communities are in core need (1,600 households).

Among specific communities, Wekweti has the highest proportion of core need in the North Slave District at 69%. In the South Slave District the highest value is for the Hay River Reserve at 61%, while 87% of households in Colville Lake is the highest value in the Western Arctic District. By comparison, the lowest level of need in the North Slave District is for Yellowknife at 11%, Kakisa is the lowest in the South Slave District at 13%, and Norman Wells is the lowest in the Western Arctic District at 8%.

Figure 2
Housing Problems and Core Need, by Type of Community
Northwest Territories

Examining the number of households that reported a problem at the time of the survey, some 4,037 households or 30% of all households had at least one type of housing problem (suitability, adequacy or affordability). Adequacy problems are the most common housing problem reported (1,913 households or 14%), followed by affordability problems (1,659 households or 12%), then suitability problems (1,340 households or 10%).

There is significant variation in the types of housing problems experienced across community types (Figure 3). The most common housing problem in Yellowknife and the combined regional centres of Hay River, Fort Smith and Inuvik was affordability which was experienced by 896 households and 380 households, respectively. This is in contrast to adequacy which was the most common problem experienced in the rest of the smaller communities in the NWT with a total of 1,110 households reporting an adequacy problem.

Figure 3
Housing Problems, by Type of Community
Northwest Territories

There was a total of 2,364 occupied public housing units in the Northwest Territories at the time of the NWT Housing Needs Survey - 2000 (Table 3). Public housing is defined as units owned by the NWT Housing Corporation and rented directly to tenants, or are units which receive rent subsidies from the government.

Figure 4
Housing Problems and Core Need, by Type of Unit
Northwest Territories

Core housing need among public housing units was 25% at the time of the survey (Figure 4). The most common housing problem for these households is suitability at 14%. Adequacy was a problem for 12% of public housing units. The design of the rent scale for public housing owned by the NWTHC (where the amount of rent is linked to household income) results in very few units with affordability problems.

Private market units comprise the majority of territorial dwellings at 11,041 out of the 13,405 total households (82%). Core housing need among private market units stood at 19%, with the main problems being adequacy at 15% and affordability at 14%.

Characteristics of NWT Households

Of the 13,405 occupied dwellings in the Northwest Territories (Table 6), 6,680 households (50%) are in the North Slave District. By comparison, there are 3,505 households in the South Slave District (26%) and 3,220 households in the Western Arctic District (24%).

With respect to household occupancy patterns, some 8% of households in the Northwest Territories are occupied by 6 or more persons. This compares with one person dwellings at 16%, 47% with 2 or 3 residents, and 29% with 4 or 5 residents. The proportion of dwellings with 6 or more residents varies by district. In the North Slave District this value is 6%, for the South Slave District 7%, while in the Western Arctic District, 12% of households have 6 or more persons.

In the past 20 years, the proportion of households with 6 or more residents has been declining in the Northwest Territories (Figure 5). While there were 14% of dwellings with 6 or more residents in 1981, this value has steadily decreased to less than 8% in 2000.

Figure 5
Households with 6 or More Persons, 1981-2000
Northwest Territories

The decrease in household occupancy patterns is also evident in the continued decline in the average persons per dwelling for the Northwest Territories (Table 8). Since 1981, the average number of persons per dwelling has decreased from 3.5 to 3.1 persons. The trend is more pronounced among many smaller NWT communities. The trend may be related to a number of factors including increased availability of housing stock, declining birth rates, changing family and household structures, changes in income, and changing preferences and expectations.

While the overall relative proportion of owned and rented dwellings is nearly equal, the South Slave District has the greatest proportion of owned dwellings at 60% (Table 6). The Western Arctic District has the lowest proportion of ownership at 34%, while 51% of dwellings in the North Slave District are owned by the dwellings occupants. For Canada as a whole, some 64% of households are owned by the occupant.

The district patterns of household tenure is reflected in the share of public housing units relative to private market units. Overall, some 18% of dwellings in the Northwest Territories are public housing units. This value is 8% in the North Slave District, 18% in the South Slave District, and 37% in the Western Arctic District.

Of the 13,405 occupied dwellings in the Northwest Territories at the time of the NWT Housing Needs Survey - 2000 (Table 7), 5,952 households, representing 44% of all households in the Northwest Territories, were in Yellowknife. The regional centres of Hay River, Fort Smith and Inuvik accounted for 3,283 households representing 25%. The remaining communities combined for a total of 4,170 households representing 31% of all households in the NWT.

Household occupancy patterns also vary by type of community. The proportion of dwellings with 6 or more persons is 4% in Yellowknife, while the corresponding combined value for Hay River, Inuvik and Fort Smith is 6%. In the rest of the communities, 15% of households have 6 or more persons.

Data on household income indicates that 39% of NWT households have a total income of \$75,000 or higher. This value is lowest in smaller NWT communities at 16% of all households, while in Yellowknife, 55% of households have a household income of \$75,000 or higher (Table 8).

Household income is an important variable in understanding housing problems and core need. Some 47% of households with less than \$50,000 income have housing problems compared with 19% among other households. Virtually all households with less than \$50,000 total income with housing problems, are also in core need. The rate of problems and core need among households with less than \$50,000 total income does not vary significantly by community type (Figure 6).

Figure 6
Housing Problems and Core Need for Households with Less than \$50,000, by Type of Community
Northwest Territories

The rental market in the different types of communities is significantly different (Figure 7). In Yellowknife, some 81% of rentals are private market rentals and 10% are public housing rentals. In Hay River, Inuvik and Fort Smith combined, the private market rentals account for 52% of the rental market, while public housing rentals account for 35%. In the rest of the communities, private market units form 13% of the rental market and 69% of rentals are public housing rentals.

APPENDIX A
METHODOLOGY

METHODOLOGY

Survey Organization

- The housing needs survey questionnaire and the survey methodology were developed by the Bureau of Statistics in consultation with the NWT Housing Corporation (NWTHC).
- Survey operations, training, and organization of community interviewers were completed by Bureau of Statistics staff. Community coordinators were recruited and trained by Bureau of Statistics staff in Yellowknife. Community coordinators then recruited and trained interviewers in each community. An interviewer manual was prepared and provided to all community interviewers.
- Local Housing Organizations identified community interviewers for the survey and assisted in the administration of the survey in each community
- All questionnaires were interviewer administered, with most interviews being completed during the period September to November 1999.
- A copy of the questionnaire is provided in Appendix D.

Sampling Procedures

- The requirement for statistically reliable estimates of housing need at the community level dictated sampling procedures used for the NWT Housing Needs Survey - 2000.
- Random sampling procedures were used in Hay River, Fort Smith, Inuvik and Yellowknife. The sampling frame used for the NWT Housing Needs Survey - 2000 was the Bureau of Statistics dwelling listing.
- In the remaining NWT communities, an attempt was made to survey all dwellings to ensure sample sizes sufficiently large for the release of community level statistics. In advance of survey operations, community coordinators in cooperation with the local housing organization listed all dwellings in the community to ensure complete community coverage.
- A survey questionnaire was completed for each sampled dwelling and included information for all persons who normally resided in the dwelling. Where an individual was not present, responses were accepted from other household members.

Data Entry and Processing

- As Community Coordinators returned completed questionnaires to the Bureau of Statistics, each questionnaire was reviewed and obvious corrections and edits were made. In some cases, respondents were re-contacted for clarification of survey responses.
- Data entry was completed directly from questionnaires on a database developed by the Bureau of Statistics, while statistical tables were prepared using the Statistical Package for the Social Sciences (SPSS).

Edit and Imputation of Data

- Following data entry, computer-assisted edits were performed to check for data entry errors and logical inconsistencies among responses.
- Where critical information for defining core need was missing, an attempt was made to impute values based on other answers for the questionnaire. Where this was not possible, the imputation procedures were used.

Questionnaires Received and Sample Weighting

- A total of 5,189 household questionnaires were completed for the NWT Housing Needs Survey - 2000. The count of households for which information was provided from each community (sample size) is presented in Table A1.
- Weighting of the statistical file was undertaken so that housing statistics were based on estimated counts of households at the community level.
- Due to the use of weighting procedures, totals for tables in this report do not necessarily sum.

Sampling and Non-Sampling Errors

- Information on the sample sizes and sampling errors is summarized in Table A1. Community, district and territorial level standard errors and coefficients of variation are provided for the estimates of core housing need. This information should be considered when statistics from this report are being used.
- The standard error statistic is used to determine confidence intervals for estimates of population values based on a sample. Most often, the 95 percent confidence interval, which should contain the true population value 19 times out of 20, is used. To determine the 95 percent confidence interval for an estimate, the standard error is doubled.
- For example the estimate of core housing need in Tuktoyaktuk is 93 households. From Table A1, the standard error for the estimate of core need is 4 households. Twice the standard error is 8, meaning that the user can be 95% confident that the number of households in core need in Tuktoyaktuk is in the interval 93 ± 8 households, that is between 85 and 101 households. Such interval estimates are highly conservative and most often population values are quite close to their corresponding sample estimates.
- The other measure of sampling error, also provided in Table A1, is the coefficient of variation (CV). This statistic is the ratio of the standard error to the sample estimate, indicating the percentage error implicit in the estimate. In the case of core need in Tuktoyaktuk, the coefficient of variation is 4.1%.
- Another source of error in surveys is referred to as non-sampling errors. These errors result from incorrect answers being given to questions, data entry errors, etc. Surveys are designed to help minimize such errors. Generally, the effect of such errors is not known.

APPENDIX B
TECHNICAL DEFINITIONS

TECHNICAL DEFINITIONS

The key measure in describing the number of households that are facing housing pressures in the Northwest Territories is core need. The definition of core need and the related housing problems are nationally set and must be used for targeting of federal funding. Although defined below, core need can generally be described as a household that has a housing problem and has a total household income below the community core need income threshold.

The following are technical definitions of terms that are used to describe housing conditions in the Northwest Territories in this report.

Housing Problem

Housing problems included in this survey are divided into three categories: suitability, adequacy, and affordability.

Suitability

Suitability refers to the problem of overcrowding or whether a household has enough bedrooms appropriate for the number of people. The number of bedrooms required for a household is determined by the *National Occupancy Standards*, which specify:

- a minimum of one and a maximum of two persons per bedroom;
- parents are eligible for a separate bedroom from their children;
- household members aged 18 or more are eligible for a separate bedroom, unless married or cohabiting spouses; and
- dependants aged five or more of the opposite sex do not share a bedroom.

Adequacy

Adequacy refers to the physical condition of a dwelling or whether a household has basic facilities to provide a safe and healthy environment.

A household has an adequacy problem if the dwelling is:

- without hot and cold running water; or
- without an indoor toilet; or
- without installed bath or shower; or
- requiring major repairs as evaluated by the household. Major repairs include more serious defects in the structural condition of the dwelling, as well as in the plumbing, electrical and heating systems.

Affordability

Affordability problems exist when a household pays an excessive amount for shelter. A household has an affordability problem if more than 30% of a household's income is paid to shelter costs (see detailed costs under the CNIT description in Appendix C).

Core Need Income Threshold (CNIT)

The CNIT is the income limit for each community that represents the amount of income a household must have to afford the cost of owning and operating a modest 3 bedroom home or, in market communities, renting a home without government assistance. The cost of owning and operating a home takes into consideration:

- The amount of the mortgage payment based on mortgage value (principle including land costs and interest) and amortized over 25 years.
- Shelter costs which include monthly taxes, monthly power, monthly heating, monthly domestic water and sewer, insurance premiums and anticipated maintenance costs.

Monthly payments based on the above criteria are calculated and the income threshold represents an income that will support these payments without a household spending more than 30% of their gross income to own and operate the home.

The NWT Housing Corporation also uses the CNIT to assist in determining an applicant's eligibility for social housing. Factors that go into calculating the CNIT for each community are: construction costs; land costs; taxes; power; heating; water & sewer; insurance premiums; and maintenance costs.

Core Need

If a household has any one housing problem (suitability, adequacy, or affordability) or a combination of problems, and a total household income below the CNIT, the household is considered to be in core need.

APPENDIX C
2000 CORE NEED INCOME THRESHOLDS

CORE NEED INCOME THRESHOLD (CNIT)

The CNIT is an income limit for each community that represents the amount of income a household must have to be able to afford the cost of owning and operating a home without government assistance. Core Need Income Thresholds are determined in different ways for market and non-market communities in the NWT. There are three market communities in the NWT: Hay River, Inuvik and Yellowknife. The Core Need Income Thresholds for these communities are based on people not having to pay more than 30% of their gross household income to rent suitable and adequate shelter - as determined through NWT Housing Corporation price surveys. In non-market communities, the cost of owning and operating a home without government assistance is used.

The NWT Housing Corporation also uses the CNIT to assist in determining an applicant's eligibility for social housing. The methodology and factors that go into calculating the CNIT for each community are outlined below:

New Unit Maximum Construction Costs (MCC):

New unit Maximum Construction Costs were developed by averaging the home ownership capital advanced to block funded communities, less any amounts advanced for administration or expenses not directly related to home ownership projects. New unit costs for non-block funded communities were based on actual tender prices divided by unit square foot sizes to determine average square foot prices for 3 bedroom home ownership units. Unit prices for Yellowknife was determined through Canada Mortgage and Housing Corporation's projected \$75.00 per square foot cost to purchase an existing modest 3 bedroom unit in Yellowknife.

Land Costs:

Derived from the Department of Municipal & Community Affairs' current *Equity Lease Agreement* for sale prices for lots in NWT communities.

Mortgage Value:

Total construction cost plus land cost.

Mortgage Payment:

Mortgage value (total construction cost plus land cost) amortized over 25 years at the current *National Housing Act* rate of 8.25%, blended payment of principal and interest.

Monthly Taxes:

For *General Taxation Area* communities, taxes were determined by applying the 1998 Mill Rate given by the Department of Municipal & Community Affairs to the new unit costs with land. For the communities of Fort Simpson, Fort Smith, Hay River, Inuvik and Yellowknife the 1998 Mill Rate was applied, plus a 3% increment to accommodate existing and proposed property tax increases for 1999 and 2000.

Monthly Power:

The rates provided by the NWT Power Corporation based on 700 kw hours (average consumption), plus 3% to accommodate the Petroleum Products Division, Department of Public Works & Services, Government of the NWT, estimate of generation fuel cost increase. The Territorial Power Subsidy Program is applied when consumption is 700 kw hours or less.

Monthly Heating:

Average consumption of 4,000 litres of heating fuel per year remains unchanged from the February 1997 Core Need Income Threshold consumption level. Monthly cost increased by 15% to accommodate the January 2000 fuel price increase projected by the Petroleum Products Division, Department of Public Works & Services, Government of the NWT.

Monthly Domestic Water & Sewer:

Monthly water and sewer services are based on average actual water consumption for NWT HC public housing units and multiplied by the domestic rate for water services.

Insurance Premiums:

Average price quoted by private insurance agents for a 3 bedroom unit in Fort Simpson, Fort Smith, Hay River, Inuvik and Yellowknife. In the remaining communities in the NWT, average prices quoted by private insurance agents for a 3 bedroom home ownership unit

Monthly Maintenance:

The NWT Housing Corporation Maintenance Services estimate.

Shelter Costs:

Includes total monthly power, heating, water & sewer, insurance and maintenance costs.

Threshold Per Year:

The CNIT is the income limit for each community that represents the amount of income a household must have to afford the cost of owning and operating a modest 3 bedroom home or, in market communities, renting a home without government assistance. The cost of owning and operating a home takes into consideration:

- The amount of the mortgage payment based on mortgage value (principle including land costs and interest) and amortized over 25 years.
- Shelter costs which include monthly taxes, monthly power, monthly heating, monthly domestic water and sewer, insurance premiums and anticipated maintenance costs.

Monthly payments based on the above criteria are calculated and the income threshold represents an income that will support these payments without a household spending more than 30% of their gross income to own and operate the home.

Core Need Income Thresholds:

Thresholds are rounded to the highest \$500.00.

Previous Core Need Income Thresholds:

The previous Core Need Income Thresholds were calculated in February 1997.

NWT Housing Needs Survey - 2000

Introduction

The NWT Bureau of Statistics, on behalf of the NWT Housing Corporation, is doing a survey to identify the housing needs of people living in this community. The main objective is to identify housing needs. However, the responses by those who already have their housing needs met also provide important information. The survey results will be used to plan for housing allocations to communities and housing programs over the next few years. We are asking you to assist by taking about 15 minutes to answer some questions.

Your answers will be kept strictly CONFIDENTIAL.

This is not an application for any housing program but the information will be used to help make decisions about housing in your community.

I would like to start by asking you a few general questions about your household.

- 1. How many people normally live in this dwelling? Include people who are away from home at school, on vacation or business, or who are in the hospital.

DK R

_____ Persons

- 2. How many bedrooms does this dwelling have?

DK R

_____ Bedrooms

- 3. Does this dwelling have interior hot and cold running water?

DK R

1 n Yes 2 n No

4. Does this dwelling have any of the following?

- | | | | | |
|-----------------------------|----------------------------|------------------------------|---------|--------|
| <input type="checkbox"/> DK | <input type="checkbox"/> R | a) bath tub or shower | 1 n Yes | 2 n No |
| <input type="checkbox"/> DK | <input type="checkbox"/> R | b) basin or sink in bathroom | 1 n Yes | 2 n No |
| <input type="checkbox"/> DK | <input type="checkbox"/> R | c) kitchen sink | 1 n Yes | 2 n No |

5. What type of toilet facilities does this dwelling have? (Check only one)

- DK R
- 1 n flush toilet (including flushomatic)
 - 2 n other indoor toilet (including electric/propane toilet/humus toilet)
 - 3 n no indoor toilet (includes honey-bucket)

6. I would like to ask you about the condition of your dwelling. Which of the following statements best describes your dwelling?

- DK R
